

Fluzone High-Dose vaccine—  
Because her immune system  
isn't 30 anymore...

Covered under  
**Medicare  
Part B**

Fluzone High-Dose vaccine is an inactivated influenza virus vaccine indicated for active immunization of persons 65 years of age and older against influenza disease caused by influenza virus subtypes A and type B contained in the vaccine. Approval of Fluzone High-Dose vaccine is based on superior immune response relative to Fluzone vaccine. Data demonstrating a decrease in influenza disease after vaccination with Fluzone High-Dose vaccine relative to Fluzone vaccine are not available.

# Intended to strengthen the immune response to influenza in adults 65 years of age and older

## Fluzone High-Dose vaccine:

- Is an increased antigen formulation<sup>5</sup>
- Demonstrated statistically superior HI titers compared to Fluzone vaccine for 2 of the 3 influenza strains<sup>6,d</sup>
- Generates up to 80% higher antibody levels (GMTs) compared to Fluzone vaccine<sup>5,6</sup>
- Provides significantly higher antibodies compared to Fluzone vaccine for people 65 years of age and older regardless of whether they have underlying medical conditions<sup>5,6</sup>

<sup>d</sup> There are no data demonstrating clinically relevant prevention of culture-confirmed influenza or its complications after vaccination with Fluzone High-Dose vaccine compared to Fluzone vaccine in individuals 65 years of age and older.

## Important Safety Information

### Indication

Fluzone High-Dose vaccine is an inactivated influenza virus vaccine indicated for active immunization of persons 65 years of age and older against influenza disease caused by influenza virus subtypes A and type B contained in the vaccine. Approval of Fluzone High-Dose vaccine is based on superior immune response relative to Fluzone vaccine. Data demonstrating a decrease in influenza disease after vaccination with Fluzone High-Dose vaccine relative to Fluzone vaccine are not available.

### Safety Information

The most common local and systemic adverse reactions to Fluzone High-Dose vaccine include soreness, pain, and swelling at the vaccination site; fever, headache, malaise, and myalgia. Other adverse reactions may occur. Fluzone High-Dose vaccine should not be administered to anyone with a severe allergic reaction (eg, anaphylaxis) to any vaccine component, including egg protein, or to a previous dose of any influenza vaccine. The decision to give Fluzone High-Dose vaccine should be based on the potential benefits and risks, especially if Guillain-Barré syndrome has occurred within 6 weeks of receipt of a prior influenza vaccine. The tip caps of the prefilled syringes may contain natural rubber latex, which may cause allergic reactions in latex sensitive individuals. Vaccination with Fluzone High-Dose vaccine may not protect all individuals.
